Catatan Peer Reviewer :

1. Tentang Kelengkapan Unsur isi

*Simpanlah penulisan artikel sesuai dengan template penulisan prosiding dan memiliki mnr yang lengkap dan jelas.*

2. Ruang lingkup dan kedalaman pembahasan  
Artikel relevan dengan bidang ilmu penulis serta pembahasan sudah cukup baik dengan menggunakan pustakan yang relevan dan terbaru.
3. Kecukupan dan Kemutakhiran data / informasi dan metodologi  
Artikel memiliki data yang cukup dan mutakhir dalam mendukung kesimpulan penelitian. Metodologi yang digunakan sudah jelas.
4. Kelengkapan unsur dan kualitas terbitan  
Jurnal proding memiliki ISSN serta dapat diakses secara online. Jurnal memiliki panduan penulisan artikel yang jelas
5. Indikasi Plagiasi  
Hasil pengecekan plagiasi dengan turnitin sebesar 21%.
6. Kesesuaian bidang ilmu  
Topik artikel sesuai dengan bidang ilmu penulis.

Catatan Peer Reviewer :

- 1 Tentang Kelengkapan Unsur isi

Artikel ini memiliki unsur isi yang lengkap sesuai dengan panduan penulisan prosiding, mulai dari abstrak sampai dengan conclusion memiliki kesesuaian yang baik.

2. Ruang lingkup dan kedalaman pembahasan

Artikel menampilkan data hasil penelitian yang lengkap dan dibahas dengan cukup baik.

3. Kecukupan dan Kemutakhiran data / informasi dan metodologi

Metode penelitian dapat dipahami, data yang disajikan sudah cukup dan referensi yg digunakan cukup relevan.

4. Kelengkapan unsur dan kualitas terbitan

Prosiding yang dituju sudah memiliki ISSN dan dapat diakses secara online. Penerbit kredibel (Poltekkes Kemenkes Makassar)

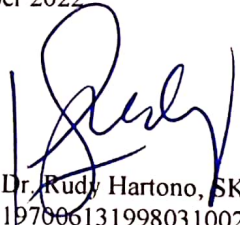

5. Indikasi Plagiasi

Tidak terdapat indikasi plagiasi

6. Kesesuaian bidang ilmu

Topik penulisan sesuai dengan bidang ilmu penulis

## Vol 2, No 1 (2019)

### Interprofessional Proceedings Collaboration on Urban Health

DOI: <https://doi.org/10.32382/uh.v2i1>

This International Conference is entitled: The 2<sup>nd</sup> Internasional Conference Interprofessional Collaboration on Urban Health; A Strategy for All Nations, and In Collaboration with the center of excellence in the urban health study center. This conference is organized by Makassar Health Polytechnic in collaboration with Palu Health Polytechnic and Mamuju Health Polytechnic. The conference also supported by Management & Science University and Lincoln University College, Malaysia

The 2<sup>nd</sup> International Conference on Urban Health also attract representatives from Budi Luhur International Network for Education (BIN for Edu), lecturer, practitioner, policymakers from Ministry of Health and Local Government, and health students.

As academia, we would like to do our best to carry out an international conference on urban health to present the newest and the recent research product related to urban health for better understanding, evaluating of research in this area, and developing a strategy for all nations on managing urban health.

This international conference aims to present and to evaluate the newest and the recent interprofessional research product for developing a new strategy managing urban health on all nations.

Scope of the conference are listed below :

Climate risk  
Air pollution  
Housing-related health risks  
Urban green spaces  
Unsafe drinking water, sanitation, and waste management  
Nutrition insecurity and unhealthy diets  
Stunting  
Food safety  
Sport, exercise, and recreation  
Physical and mental health  
Maternal and child urban health  
Stress and sleep disturbances  
Non-communicable disease  
Drug abuse and misuse  
Herbal medicine  
Sexual behavior and transmitted disease-related  
Expensive medical check and treatment  
Oral health  
And any other urban health risk related

The present volume contains selected abstract about health urban held on July 18-19, 2019 in Makassar Indonesia.

We would like to thank all those who have contributed. We hope this proceeding can be useful to support the development of science particularly with respect to the quality of human resource development and research in the future

# DETERMINATION OF TOTAL PHENOLIC CONTENT (TPC) AND ANTIOXIDANT ACTIVITY OF LONGAN (*Euphoria Longana*) SEED AND PEEL EXTRACTS

Alfrida Monica Salasa<sup>1</sup>, St. Ratnah<sup>1a</sup>

<sup>1</sup>Pharmacy Department, Health Polytecnic of Makassar

<sup>a</sup>Corresponding author : [mansjurratnah@yahoo.com](mailto:mansjurratnah@yahoo.com)

## ABSTRACT

Longan (*Euphoria longana*) is a widely consumed fruit in Indonesia. The flesh is consumed, while the seed and the peel of Longan remain as waste despite of its chemical contents such as phenolic compounds (phenolic acids and flavonoids) with antioxidant properties. This study aimed to determine the total phenolic contents (TPC) and antioxidant activity of Longan seed and peel extract and to find out the relationship between total phenolic content and antioxidant activity. The seed and peel of Longan was separated from the flesh, then mashed and then dried. Furthermore, Longan seed was extracted by soxhletation method and fruit peel was extracted by maceration method using 96% ethanol as a solvent. The diluted extract was evaporated until a concentrated extract was obtained. The TPC was determined using Folin ciocalteu reagent and the absorption was measured using a UV-VIS spectrophotometer at a wavelength of 745 nm. Antioxidant activity was determined using 1,1-diphenyl-2-picryl-hydrazil (DPPH) reagent and the absorption was measured using a UV-VIS spectrophotometer at a wavelength of 516 nm. The TPC of Longan seed extract was 17.24% while fruit peel extract was 9.67%. Antioxidant activity expressed as IC<sub>50</sub> for seed extracts was 57.24 ppm (strong antioxidant) and fruit peel extracts was 120.82 ppm (moderate antioxidant). These results indicate that Longan seed extract has a higher TPC and stronger antioxidant activity compared to Longan fruit peel extract. It can be concluded that the higher the TPC the more active the antioxidant activity

**Keywords** : Longan Seed Extract, Longan Peel Extract, TPC, Antioxidant Activity

## INTRODUCTION

Natural plants contain phytochemical compounds with antioxidants and antibacterial properties. Longan (*Euphoria longana*) Stend (Harborne, 1987) is a widely consumed fruit in Indonesia with aforementioned properties. The most edible part of the fruit is the flesh, while the seed and the peel remain as organic waste. Despite as organic waste, both contain phytochemical compounds that can be used both as antioxidants and antibacterial. Based on the results of several scientific studies, Longan seed and peel have various chemical compounds. Jaitrong et al. (2006) reported that the chemical content in the fruit peel is gallic acid, flavone glycoside, and hydroxynamic with the main content of flavone in the form of quercetin and kaemferol while Longan Seed Components are in the form of Phenolic and Flavonoids. Some of chemical compounds that actively act as antioxidants include polyphenol compounds (phenolic acids and flavonoids), alkaloids, steroids or triterpenoids (saponins), and anthraquinones (Bai et al, 2013 in Perwiratami et al, 2014).

## METHOD

### 1. Sample Preparation

Longan fruit were collected from the fruit store. The fruit was washed and left

to dry. The flesh was separated from the peel and the seed. The seed was washed to remove the remaining flesh. After that, the seed was roughly grown and dried. The peel was cut into small pieces and left to dry.

### 2. Extract Preparation

Longan seed was extracted by soxhletation method and fruit peel was extracted by maceration method using 96% ethanol as a solvent. The diluted extract was evaporated until a concentrated extract was obtained.

### 3. Determination of TPC

#### a. Qualitative Evaluation

The concentrated extract was dissolved in 2 ml of ethanol 96%, added 1 ml of 10% Ferric Chloride. The formation of dark blue, blackish blue or greenish black color indicates the presence of phenolic compounds.

#### b. Quantitative Evaluation

Standard solution of gallic acid series 10, 20, 30, 40, 50 and 60 ppm was prepared. 25 mg of each extract was weighed and transferred into 25,0 ml volumetric flask, then it was diluted by ethanol 96% to make a stock solution of 1 mg/ml. 2,0 ml of stock solution was diluted in a 10 ml volumetric flask

to make a final concentration of 0,2 mg/ml. Each standard solution and diluted extracts was piped as much of 0.3 mL and then transferred into a vial. 1,5 ml of Folin (1:10) was added and left to stand for 3 minutes. After 3 minutes, 1,2 mL of 7,5% Sodium Carbonate was added and let it sit for 30 minutes. The absorption was measured using a UV-VIS spectrophotometer at a wavelength of 745 nm.

The antioxidant activity was measured based on the method developed by Mensor et al with some modifications, using 2,2-diphenyl-1-picryl-hydrazyl (DPPH). Stock solution of 1 mg/ml of the extract were diluted in ethanol to final concentration of 15, 30, 45, 60 and 75 µg/ml (ppm) for the Longan seed extract and a final series concentration of 30, 60, 90, 120 and 150 for the Longan peel extract. DPPH solution were added to the diluted sample and allowed to react at room temperature for 30 minutes. Each concentration was replicated three times. The absorbance values were measured at 516 nm

#### 4. Antioxidant Activity Assay

### RESULT AND DISCUSSION

#### 1. TPC

##### a. Qualitative Test

Type of Extract	Reagent	Observation	Conclusion
Seed	FeCl <sub>3</sub>	Blackish green	+
Peel	FeCl <sub>3</sub>	Blackish Green	+

##### b. Quantitative Test

The TPC was determined using Folin ciocalteu reagent and the absorption was measured using a UV-VIS

spectrophotometer at a wavelength of 745 nm, the result was shown at the table below :

Sample	Weight (gram)	TPC (mgGAE/g extract)	TPC (%)	TPC Average (%)
Seed Extract	0,0251	177,04	17,70	17,24
	0,0255	171,67	17,17	
	0,0258	168,45	16,85	
Peel Extract	0,0258	89,19	8,92	9,67
	0,0254	103,05	10,31	
	0,0253	97,83	9,78	

#### 2. Antioxidant Activity Assay

Antioxidant activity was determined using 1,1-diphenyl-2-picryl-hydrazil (DPPH) reagent and the absorption was measured using a UV-VIS spectrophotometer at a wavelength of 516 nm. The result was presented in the table below :

Table 3. Antioxidant Activity of Longan Seed Extract

Replication	Concentration (ppm)	Absorption	% Inhibition	IC50 (ppm)	IC50 average (ppm)
I	15	0,74264	16,5469	56,61	
	30	0,64901	27,0685		
	45	0,53496	39,8847		
	60	0,42482	52,2615		
	75	0,30145	66,1250

	DPPH	0,88989			

## DISCUSSION

This study aims to determine the TPC and antioxidant activity of Longan Seed and Peel Extract. The most edible part of Longan fruit is the flesh, while the seed and the peel remain as organic waste. However the remaining organic waste contains chemical compounds in the form of phenolic compounds act as antioxidants. Antioxidant

activity of phenolic compound is based on their ability to form phenoxide ions as a donor electron to free radicals to form non-radical compounds.

The seed and peel of Longan was separated from the flesh, then mashed and then dried. Furthermore, Longan seed was extracted by soxhletation method and fruit peel was extracted by maceration method using 96% ethanol as a solvent. The

selection of extraction methods was adjusted to the texture of each simplicia, where the longan peel had a soft texture so that the extraction method used was maceration. While longan seed had a rather hard texture so that the soxhletation method was used. Ethanol 96% which is a semipolar solvent dissolves all polar and nonpolar compounds so that all the natural compounds can be extracted perfectly. The diluted extract was evaporated until a concentrated extract was obtained and tested for TPC and antioxidant activity.

The TPC testing began with a qualitative test using  $\text{FeCl}_3$  reagent to determine whether the seed and the peel contain phenolic compounds. Both extract reacted with  $\text{FeCl}_3$  forming a blackish green color which confirm the presence of phenolic compounds. The test was continued to determine the TPC quantitatively using Folin ciocalteu reagent and sodium carbonate. This method is based on the strength of reducing the hydroxyl groups of phenolic compounds. Folin ciocalteu reacts with phenolic compounds to form yellow color and after addition of sodium carbonate, the solution will be in blue color. Sodium carbonate provides an alkaline atmosphere for the overall reaction which allow folin ciocalteu to react with phenolic compounds, which cannot be done in an acidic atmosphere. The presence of aromatic nuclei in phenol compounds reduce phosphotungstate phosphomolibdate to blue molybdenum. The absorption was measured by using UV-VIS spectrophotometry at a wavelength of 745 nm. The standard solution for TPC was gallic acid. The results showed that the TPC equivalent to gallic acid for seed extract was amounted to 17.24% while for the peel extract was 9.67% indicating that the TPC of the seed extract was greater than that of the peel extract.

The next assay was the antioxidant activity assay using DPPH as a reagent. DPPH is a stable free radical with purple color (absorbed at 516nm). If free radicals have been scavenged, DPPH will generated it's color to yellow. This assay uses this character to show herbs free radical scavenging activity. Antioxidant activity is expressed in Inhibition Concentration 50% ( $\text{IC}_{50}$ ).  $\text{IC}_{50}$  represents the concentration in which the inhibition of free radical DPPH by 50%. Antioxidant activity expressed as  $\text{IC}_{50}$  for seed extracts

was 57.24 ppm (strong antioxidant (50-100 ppm)) and fruit peel extracts was 120.82 ppm (moderate antioxidant (101-250 ppm)). This result indicated that the longan seed extract has a stronger antioxidant activity than the longan peel extract.

Based on the result on TPC and antioxidant activity, there was a correlation between the TPC and the antioxidant activity. The higher the TPC the stronger the antioxidant activity.

## CONCLUSION

Based on the result it can be concluded that:

1. TPC of Longan seed and peel extract was 17,24% and 9,67% respectively.
2. Antioxidant activity expressed as  $\text{IC}_{50}$  was 57,24 ppm for the Longan seed extract and 120,82 ppm for the Longan peel extract.
3. There was a correlation between the TPC and the antioxidant activity. The higher the TPC the stronger the antioxidant activity
